Introduction

Cultural heritage significance

The Stockholm Exhibition, or in Swedish *Stockholmsutställningen*, was an exhibit of Swedish design, architecture and crafts that took place in Stockholm between the 16th of May and 29th of September in 1930 (Figure 1). It was arranged by The Swedish Arts and Crafts Association, *Svenska slöjdföreningen* (which underwent a name change to *Svensk Form*, Swedish Design Association, in 1976) and the City of Stockholm.

This important fair, which focussed heavily on the architectural style Functionalism, came to provide an opportunity for the Swedish lighting industry to showcase the latest developments in technology and design. The lighting, especially at night, was an important part of the exhibition experience and attracted a lot of attention. Among other things the event led to a breakthrough for neon signage in Sweden. The civil engineer who worked on the lighting, Ivar Folcker, is considered to be one of the pioneers of light architecture in Sweden, and was instrumental in designing the light installations for the 1930 Stockholm Exhibition (Garnert, 2017). Folcker was one of the founding members of *Svenska föreningen för ljuskultur* [The Swedish Light Culture Association], which was responsible for publishing the brochure. The organisation celebrates its centennial this year, and nowadays goes under the name *Belysningsbranschen* (Belysningsbranschen, 2026).

The brochure from the exhibition that has been digitised contains a handwritten dedication from Folcker to the Stockholm Exhibition's general commissioner, Gregor Paulsson. Paulsson, as Managing Director of *Svenska slöjdföreningen* was one of the people in charge of organising the Stockholm Exhibition (Alenius, 2022, 74, n. 41). It is therefore not only of interest to the organisation wishing to preserve its materials, *Svensk Form*, as a record of its history, but also potentially of wider interest to researchers and even the wider public as it documents an important event in Swedish cultural history and is linked (via a handwritten dedication) to an important figure in Swedish architectural history.

The archive and the owner of the material

The Centre for Business History, *Centrum för Näringslivshistoria* [CfN], is an association that provides archiving for its member organisations, thus functioning as a corporate historical archive. They manage three depots, containing 87 000 shelf metres from around 300 depositors. Organised both as a non-profit and as a limited company they are well attended by researchers and students, but also sell archiving and digitising services. Once digitised, material can be accessed via an e-archive platform and password protected digital reading room, *Digitala läsesalen* (Centrum för Näringslivshistoria, 2026).

The Swedish Design Association, *Svensk Form*, is a Swedish non-profit organisation that focuses on design. Specifically, it promotes the “awareness and development of good design and design of products, services and environments” (Svensk Form, n.d.). According to their website, they are the world’s oldest design organisation, founded in 1845 under the name *Svenska Slöjdföreningen*. *Svensk Form* is the owner of the material from the Stockholm Exhibition, and the physical material from the event is partly stored at their own premises and partly at *Centrum för Näringslivshistoria*.

Materials and methods

Material

We chose to collaborate with CfN after an initial opportunity to digitise material connected to a 1998 theatre production archived at the Stockholm City Theatre fell through, due to concerns about copyright. In the case of the material available to us through CfN there were fewer concerns about copyright as the material from the Stockholm Exhibition was older. This therefore satisfies one of the criteria for digitising specified by Cowick (2018, p. 23), namely that of copyright and legal aspects. Additionally, at a first meeting with our contact at CfN in early March we discovered that they previously had started the digitisation process on behalf of *Svensk Form*, beginning with volume 1 and 2. It was therefore much appreciated that we would focus our project on material from the third volume. The box folder containing these materials was housed at the Swedish Design Association in Skeppsholmen and it was therefore couriered to CfN's facilities in Bromma in order for our group to examine it further.

Figure 2. The archival inventory of volume F3D:3 contained within the box folder sent to CfN for our group to digitise from.

The box folder contained materials from volume F3D:3 (Figure 2) of the archived materials from the Stockholm exhibition in 1930. Access to view volume 1 and 2 through the digital reading room [*Digitala läsesalen*] was granted to us, to be able to get a sense of the quality and scope of digitisation (Centrum för Näringslivshistoria, 2026). There were 12 unique items in the box folder (Figure 3). After close inspection we selected the brochure on electrical light at the Stockholm exhibition - *Det elektriska ljuset på Stockholmsutställningen 1930*. There were several factors that played a role in choosing this particular brochure. One was that we

assessed it to be of historic cultural value due to its documentation of an integral part of the Stockholm exhibition, the lighting. An added bonus was the fact that the content within provided a multifarious idea of the exhibition as a whole, due to so many locations being documented in it. The brochure is 21 x 30 cm, and consists of 24 pages with text and black-and-white photographs, plus a light brown printed paperboard cover with a map of the exhibition area printed on the inner front and inner back. The map highlights the contents of the brochure by markings indicating from where the photos on each page were taken. Compared to previously digitised material from the exhibition the content of this particular brochure was very diverse, as it contained a mixture of pages with black and white photography, illustrations, text, some handwriting, and stamps. It had not been digitised earlier and was in good condition, allowing for ease of digitisation using a mobile phone camera. This satisfies several of the criteria in the priority list for digitisation listed in Cowick, making the brochure at least a “medium priority item”, with an estimated 14 points (2018, p. 13). Additionally, the brochure was a clearly delineated material that we felt fell within the scope and time constraints of this being a student project.

Figure 3. All the material contained as part of volume F3D:3

Digitising tools

The following materials were used when digitising the brochure:

- Mobile phone camera
- Stand
- Grey background paper
- Ruler

The mobile phone used was a OnePlus 11 5G. Specifications of the back-facing Hasselblad camera are given in Table 1. The stand was provided by CfN and was a Kaiser RS2 XA.

Table 1. Specifications of the back-facing camera on the OnePlus 11 5G.

Sensor	Sony IMX1890
Sensor size	1/1.56"
Megapixels	50 (*note: only in Pro mode, otherwise 12 MP)
Pixel size	1.0 μm
Lens quantity	6P
Optical image stabilization	Yes
Electronic Image stabilization	Yes
Focal length	24 mm equivalent
Aperture	$f/1.8$
Field of view	84°
Autofocus	Yes

Digitisation process

We worked with the material on-site on two occasions, on the 26th of March and on the 16th of April, 2026. During the first of these two visits we decided on the material and conducted photography trials using a DSLR camera and the mobile phone camera, as well as took measurements of the brochure using a ruler to be able to calculate dpi by hand. We were able to ascertain by eye that the quality of the images taken by the mobile phone camera was higher. After the trial photo session we calculated the dpi of the images (as per Cornell University Library, Digital Imaging Tutorial, 2003) and found that we needed to retake the images. This is because we would need to position the camera quite a lot closer to the material as well as

employ the camera's pro mode in order to reach 300 dpi, as is recommended for digital reproductions (Deutsche Forschungsgemeinschaft, 2013, p. 6). We therefore conducted a second photo session in April during which images were captured as 50 MP JPEG:s under existing light conditions (i.e. a combination of daylight falling in from the window, tempered by semi open blinds, in combination with office strip lights further away from our workstation). Our material was in good condition and not overly sensitive to light, so we could have used more intense light in theory, however in practice we did not have access to lights beyond office lights and we assessed these as being sufficient (Deutsche Forschungsgemeinschaft, 2013, p. 16). We also decided to capture every page of the brochure in RAW-format, to have at our disposal.

Figure 4. Our workstation, showing the positioning of the mobile camera

Image post-processing

The post-processing of the images turned out to be quite time-consuming work, mainly due to the fact that no one in our group has a vast experience in the field of photography or graphic design. Since one person in the group had recently acquired a student license for Adobe Creative Cloud we decided to use Photoshop for the post-processing of the images. The images were cropped leaving just a thin grey border around the edges of the brochure. In order to allow each digital proxy to stay as close as possible to the original we did not do any type of

retouching or altering of the images. As it turned out four images did not have the sharpness we desired, and in these cases we used the RAW files (instead of the 50 MP JPEG:s), which were exported to JPEG. A further discussion of file types as well as challenges and limitations encountered is provided in the Discussion section below.

TEI encoding and text transcribing

Since the material being digitised was a brochure, intended to be delivered to the stakeholder as a PDF, we decided to encode the material in a single XML file, with a single TEI Header. This work was mostly done in the XML editor oXygen, which provides a great deal of help in validating the code and telling you what is required to fix certain problems. However, it is not free software, and since coding really only requires a text editor, this can be seen as a major drawback, but thanks to their rather generous trial periods, we were able to work on the XML file in oXygen without purchasing a license. The GitHub DCHM-template (Dillen, n.d.), developed by our teacher Wout Dillen, was a great help and starting point. Once the basics of using GitHub and Git Desktop were grasped and some confusion resolved, the TEI-encoding went quite smoothly. Since each page of the 28 pages of the brochure were treated in a similar manner, encoding soon turned into a familiar procedure.

The transcribing of the text in the brochure was done from the images, once the JPEG:s used for presentation had been uploaded to the GitHub repository. Text transcribing was done in tandem with working on the encoding and followed the TEI guidelines (2026). Before linking to an image in the XML file, the text on the image was scanned, using an OCR function in the Photos app in Windows 11. The text was then saved in a text document from where it could easily be copied and pasted into the XML file. The scanning function in the photo viewer worked surprisingly well for this material — sometimes a little too well, since it also captured text that was depicted in the black-and-white photos reproduced in the brochure. Pages where text was rendered in columns also provided some challenge, since the text would be scrambled upon pasting. Some post-editing of the text-blocks was therefore required in several cases, but the scanning function in the Photos app still made transcribing a quite manageable and not too time consuming task. We made sure to proof-read each other's transcriptions to ensure accuracy and authenticity (Cowick, 2018, p. 5). There was some handwritten text added to the printed matter, which we wanted to transcribe, so this of course had to be done manually, and especially the handwritten dedication on the cover page required a little interpreting, which will be further discussed below.

Metadata

PDF/A and image metadata was added using ExifTool version 13.59 (Harvey 2026). In addition to pre-existing metadata we added DublinCore elements for creator, source, subject, language, type, rights and title to the images and additionally identifier, description, date, publisher, relation, coverage and contributor to the PDF-A document (DublinCore 2012). We included

additional metadata elements in the `teiHeader` section, including a `xenodata` element linking to the image metadata XML files on the GitHub repository.

Website creation and coding

As mentioned above, we elected to use the pre-existing GitHub templates provided by Wout Dillen for the purposes of creating and hosting a website with our digitised material. The existing XSLT, CSS, and HTML files were edited according to our needs and an additional JavaScript to allow for zooming in was adapted from a previous years group project freely available on GitHub (Spajic et al., 2025). We opted for an index page to introduce the project and provide context for the material, a transcription page for each page of images and corresponding text, a gallery view for enhanced viewing of the images of each page, and a flipbook view to simulate turning pages in the physical brochure .

Long-term preservation

For the purposes of this project the JPEG images were uploaded to GitHub, while the TIFF files were stored locally on hard drives. The files will be preserved at these locations unless the copyright holder (Svensk Form) requests their removal. As this was a collaboration with CfN, we have complied with their standard which is to supply a PDF of the JPEG¹ images of the brochure along with metadata specified in an excel spreadsheet. These files will be administered by them for the foreseeable future and the PDF will be uploaded to their digital reading room (Centrum för Näringslivshistoria 2026). The archival quality PDF/A-2b document and the XLSX metadata spreadsheet² have also been uploaded to GitHub. The PDF/A-2b standard is suitable for documents consisting of scanned JPEG images (Riksarkivet 2024).

¹ While we offered CfN a transfer of the JPEG as well as TIF files of the images, these were politely declined.

² The headings marked in yellow indicate which metadata CfN considers obligatory. As can be seen we have provided additional information in some of the other cells as well.

Time commitment

The total time spent on the project, including that spent on initially scoping another digitising opportunity with the Stockholm City Theatre, was 621 hours. A more detailed breakdown of how many hours in total were spent on which activities is given in Table 2.

Table 2. Time allocated to activities within the project, with hours spent on Stockholm City Theatre material within brackets.

Activity	Hours spent
External communication and organisation - including meetings	10 (7)
Internal communication and organisation	115 (20)
Assessing material	6 (2)
Digitising material, image capture	20
Post-processing images	52
Transcribing and proof reading text	20
GitHub and coding	122
TEI file	63
Metadata	50
PDF/A creation	8
Report writing	75
Background research, literature reading etc.	80
Total	621 (29)

Discussion

As mentioned above, the brochure contains a dedication on its front cover. This dedication, handwritten with a pencil, seemed important to decipher, for cultural heritage reasons. While the first half of the dedication - "Till Fil. d:r Gregor Paulsson" - was quite easy to read, the word "vördsamt" and the signature of the dedicator had to be surmised from the context. The very same signature can be found printed on the bottom of page one in the brochure. It is obviously there on behalf of the publisher *Svenska föreningen för Ljuskultur*, which makes it highly plausible that the signature is that of Ivar Folcker, who was a founding member of this association, was in charge of the light installations at the exhibition, and who is listed on page two as responsible for compiling the brochure. The handwritten dedication could suggest that this particular copy was Paulsson's personal one. As already mentioned above Gregor Paulsson was Managing Director of *Svenska slöjdföreningen* and general commissioner of the Stockholm Exhibition. Research, or investigations, such as these would possibly not have been undertaken in a large scale automated digitisation project, such as for instance Google Books, where this type of critical approach may not be possible or feasible (Dahlström & Hansson 2019, p. 2; Dahlström 2011, pp. 94-95).

It is worth mentioning that understanding the difference between various types of files and how best to make use of the images we had captured in the context of this project also took some time and consideration. An intellectual post-image capture process, if you will, ensued where we discussed and weighed the course requirements and best praxis against the requirements of the stakeholder back and forth. Page six of the Deutsche Forschungsgemeinschaft (2013) guidelines for digitisation specifies that digital masters should be stored as TIFF files. We ended up primarily working with the 50 MP JPEG:s since this was CfN's preferred format, and our belief was that they were also of high enough quality to be used for our presentation and website.

During our time working with the project there were quite a few challenges and limitations that affected the process, and also the final outcome. For learning purposes it would have been very interesting to be able to examine differences in image quality between scanning and photography, as well as comparing the expenditure of time in order to assess possibilities of undertaking work on a larger amount of material from volume F3D:3. Since the scanners used at CfN are connected to their network, it was not possible for us to have access to these, due to the potential accessing of restricted and classified information (such as corporate secrets of member organisations). Given that our personal resources as students are limited, most of the pre-production was therefore dedicated to attempting to find solutions for the best possible image capture. Our temporary work station became perhaps slightly more makeshift than one would have wished, which in turn affected the level of photographic flawlessness that we were able to reach. As a concrete example, it was not possible to capture a substantial grey border around the brochure, without also capturing parts of the stand or the desk. This was due to the stand available at CfN being slightly inoperative as the clip intended for holding the mobile camera was unable to keep it in a position level with the material. We managed to solve this by

instead placing the mobile phone on the frame of the stand itself, as shown in Figure 4, though this restricted how close to the material we could position the camera. As a result this left things to be addressed in the post-processing of the images, and affected what was possible to achieve when cropping the images (for instance allowing only a thin grey border around the brochure to be visible). Working with detailed cropping on a laptop with a trackpad, rather than using a large monitor and separate mouse, is definitely challenging and affects the final result. Attempts were made to use the Straighten tool in Photoshop, but in this particular case it affected the representation of the original in an unhelpful way.

The TEI coding was carried out using the DCHM-template as a model. The reason for encoding the entire material in a single XML file was motivated by the properties of the material in question and the requirements of the stakeholder (CfN). We decided to use one header for the whole brochure because it is one work consisting of many pages so it does not make sense to do a header for each page. OCR was initially not considered a necessary option, since the text volume of the material is not very large. We considered it to be quite manageable transcribing the text manually, and the first few pages were indeed transcribed this way. However, the “Scan text”-function in the Windows 11 Photos app worked well for capturing the text on the images. The scanning output actually did not render any character incorrectly, the editing being relevant only in a few cases. Therefore, the accuracy-criterion described in Tanner (2004, p.5) was satisfied, and the use of OCR was deemed feasible.

It was difficult to ascertain to what extent it was really permissible to upload the digitised images to GitHub and make them available online for the purposes of grading for this project. Since we are not going to make this digitisation freely available online, copyright issues are possibly not as critical as they would otherwise have been. However, our GitHub repository will have to be made publicly available in order for our teachers and supervisors to be able to assess and grade our work. We plan to make the repository hidden once this process has been finished.

It is important to acknowledge ethical aspects of this digitisation project due its nature of being a collaboration with an organisation that has a commercial branch. This introduces the ethical issues of selection bias and limits to access (Manžuch 2017, p. 6). The original material was already organised by the owning organisation into volumes, of which we had access to one that had not previously been digitised. The content of this volume was pre-selected, presumably by *Svensk Form*, and this means that an archivist has made decisions on what material should be preserved which may or may not reflect the interests of researchers or the public. Another is that of limited access, which is implemented and enforced by CfN’s digital archive. While the digital material is theoretically available online through their digital reading room, it is not publicly accessible as it is password protected and permission must be sought. This is of course a way to help curb copyright concerns. It also has the potential to help fund digitising efforts by making the material accessible for a fee. Our collaboration with CfN ostensibly amounts to us providing digitised material free to a commercial entity, however, the organisation did provide support “in kind” through allowing access to their facilities and guidance by an archivist, Krister Hillerud.

Digital cultural heritage scholar Slavko Milekic argues that digital spaces can more effectively contribute to learning and engagement with cultural heritage objects by enhancing their tangiality. Tangiality is the in-between space “where interactions with virtual data produce tangible sensations” (Milekic 2007, p. 371). Milekic gives the example of the digital magnifying glass as one such way to enhance virtual exploration/learning/engagement. We therefore decided to implement such a tool on our website (via the Gallery page), also as a means to reflect our own journey of discovery of the handwritten dedication on the front cover through enabling a closer examination of the material. In this way, the interested user, with their own skills and expertise is invited to interact with the brochure and perhaps discover further information that would otherwise be difficult to see without recourse to larger monitors or screens than that of typical personal laptops.

Conclusion

Since there is already an established contact between Borås university and CfN, it will probably be possible for future student projects to keep working on the material in volume F3D:3. In which case several technical limitations need to be taken into account. Our contact at CfN, Krister Hillerud, was very friendly and accommodating, and even lamented the fact that the archive had not yet acquired a better mobile phone stand, like one they had recently come across when visiting *Stadsarkivet* [The Stockholm City Archive]. It does seem that this type of equipment is something CfN are considering obtaining, and we would recommend asking about this early on if initiating further collaboration. Another potential solution concerning image capture would be to draw up some kind of agreement between the university and CfN to allow participating students to sign some kind of temporary contract or non-disclosure agreement, to make it possible to use the in-house scanners. For post-processing of images ideally one would have access to a stationary computer with a large, high resolution monitor. This would positively affect the quality of the work, as well as improve ergonomics for the students.

As the infrastructure to conduct a digitising project at scale exists through CfN – not only due to physical space and Svensk Form’s membership, but also the digital infrastructure to host, archive and make digital files accessible to a wider public, as well as existing templates for metadata – it would be a shame not to continue the collaboration. It is, however, relevant to consider that CfN has other standards than the course has for digitized products (i.e. PDF/A and JPEG rather than TIFF, other metadata requirements). At a glance, the majority of remaining material in volume 3 (see Figures 2 and 3) would require substantial work with text which would make it relevant to use OCR more extensively.

Acknowledgements

We would like to thank Krister Hillerud at *Centrum för Näringslivshistoria*, IngaLill Rydberg at Stockholm City Theatre, our teachers Wout Dillen and Mikael Gunnarsson, and acknowledge the work of previous students Ana-Marija Spajic, Cilix Almgren, Charles Hagstedt and Ebba Rubensson.
